

**ABSTRACT**

The present invention is configured that specific information used for determining whether or not to create a folder with a name generated in accordance with a given rule has been previously written to an information recording medium, and that an information recording apparatus reads the specific information from the information recording medium, and only in the case where the specific information has been written, the information recording apparatus automatically generates a name of a folder in accordance with a given rule and writes the information to the folder. Thus, the user can store the information in the folder with the consistent name that facilitates the user to search and manage the information. Further, the folder name is configured using a lot of numbers, characters and symbols, so that the name can be uniquely created, and as a result, the problem such that the folder name is duplicated among a plurality of information recording mediums is prevented, thus the information management is facilitated.
